

TabCompletion

September 16, 2019

Tab completion acts as an autocomple It can be for used for instances, functions, keywords, or commands

```
[1]: array = [1, 2, 3]
```

Try pressing th *Tab* key after both to see available options

```
[ ]: a
```

```
[ ]: array.
```

VARY: This is using a Jupyter notebook and will be different using the command line
